## Exhibit F

### **Hillside Safety Measures and Reviews. Section 5-10-9**

The Safety Section of the code is intended to reduce the negative impacts of hillside construction on neighboring properties and to promote public safety. Hillside properties are prone to natural hazards and the safety section of code is designed to protect lives and property from disasters resulting from hillside development and to mitigate the potential issues such as increased erosion, boulders rolling, rockfalls, landslides, construction traffic, and construction parking.

During the March 22<sup>nd</sup> Council work session, staff was directed to identify how the hillside safety checklist and safety process will work on a sample property. The scenario or example is the development of a new single-family residence on a one-acre previously undeveloped property. Since the application is for a new home, it requires a Concept Hillside Committee review and Formal Hillside Committee review.

#### Current Hillside Code Process

An application for a new hillside home has two Hillside Committee reviews: Concept review (similar to a work study session where direction is given but no action is taken) and a Formal review (where the Hillside Committee either denies, approves, or approves the application with stipulations). Neighbors located within a 1,500-foot radius are notified of the upcoming Committee review. Notices are mailed out three weeks before each Hillside Committee meeting. Staff reviews the plans for code compliance and completeness (including safety items such as a geotechnical report/seismic refraction survey and a drainage report). Once the application receives Hillside Building Committee (HBC) approval at the Formal review, the applicant may apply for building permits. The current hillside process for a new home is approximately 6 months.

#### Draft Hillside Code Process

The applicant will have a pre-application meeting with staff to discuss the project, hillside requirements, and Safety Improvement Plan process and requirements. The applicant can choose to submit the Safety Improvement Plan (SIP) with the Concept Review submittal or the Formal Review submittal. However, the SIP must be reviewed and deemed complete by the Town prior to Hillside Building Committee Formal Review.

Staff will review the new hillside home application for completeness and will forward the request to the HBC for the Concept review. After the Concept review, the applicant will submit the Safety Improvement Plan with the Formal Review. The applicant must notify all neighbors located within a 1,500-foot radius that:

- The Safety Improvements Plans were submitted to the Town.

- The plans are available for review at the Town.
- The neighbors have 45 calendar days to provide the Town with their review comments.
- Any comments regarding the Safety Improvements Plans must be sealed by a technical registrant.

The Town Engineer, the Town's Technical Advisory Board, and the Town's Third-Party Technical Advisors will review the plans in accordance with the hillside safety improvement checklist. After the first review is finished, staff will provide the applicant with the Town's review comments and the neighbor's review comments. The applicant will resubmit updated plans and documents in response to the review comments. Once the updated plans are reviewed and deemed complete, the application will be forwarded to the HBC for Formal review. During the Formal review, the HBC will approve, approve with stipulations, deny, or continue the application. Once approved, the applicant must submit building permit application within twelve months of the HBC approval. During the building permit process, the applicant will be required to submit a Construction Staging Plan for Town Building Official and Town Engineer review. An approved Construction Staging Plan will be issued as part of the building permit.

The new safety requirement may add 3 to 6 months to the hillside review process, depending upon the completeness of the application, the scope of work and when the Applicant submits the Safety Improvement Plan. The estimated review time for a new home will take approximately 9 to 12 months.

Staff contact several contractors and a Geotech Engineer regarding the costs associate with a construction staging plan and Geotech Report & Seismic Refraction Survey. The cost for a construction staging plan varied from \$2,500 to \$5,000 and the estimated cost for Geotech report was approximately \$6,900.00

A copy of the Hillside Construction Staging & Safety Improvement Checklist and a Timeline Chart are also enclosed for reference.
